Section 7 Entity Relationship Report

Section 7 Entity Relationship Report

1.0 INTRODUCTION

This section contains the DoD Data Model Entity Relationship Report. Listed herein is every relationship in the DoD Data Model in order of parent entity. There is one line of information per parent-child relationship. The information specified below appears within each line of the report.

- 1. Parent Entity DDDS Counter Number
- 2. Parent Entity DDDS Version Number
- 3. Parent Entity Type (Independent or Dependent)
- 4. Parent Entity (Prime Word) Name
- 5. Relationship Type (Identifying, Non-Identifying or Subtype)
- 6a. Carninality (Zero, one, or more)
- 6b. Subtype Type (Complete or Incomplete)
- 7a. Business Rule Name (Verb Phrase)

If the verb phrase "Unspecified Verb Phrase" appears, it is a placeholder for a "to be determined" future submitted business rule.

- 7b. Subtype Discriminator Name
- 8. Child Entity DDDS Counter Number
- 9. Child Entity DDDS Version Number
- 10. Child Entity Type (Independent or Dependent)
- 11. Child Entity (Prime Word) Name

Section 8

DoD Data Model Enhancements Report

Section 8 DoD Data Model Enhancements

1.0 INTRODUCTION

This section contains the list of additions, deletions, and modifications to Candidate and Approved DoD data standards from the DDM version 4-97 Quarterly Report, which was the baseline for the DDM version 1-98 Semi-annual Report. All other data standards in the DDM were defined as "part of," or "prior -to" the DDM 4-97 baseline.

The information portrayed in this table are: the DDDS Counter-ID, DDDS Data Element name, and, DDDS Status of each updated data standard as of the cutoff date. The purpose of the DDDS Status is to give the data administration community information about the dependability of the entity and attribute names contained in the DDDS. The risk associated with using an entity or attribute in a new model or system is related to the data standard's DDDS status. If the DDDS status is:

APPROVED (A) - The data standard is part of the DoD Data Model, and has passed cross-functional examination. The risk of using this entity or attribute is LOW to NONE.

CANDIDATE (C) - The data standard is currently under cross-functional review to become an Approved data standard. The risk of using this entity or attribute is MEDIUM.

DEVELOPMENTAL (D) - This item has only been reviewed within the functional area model where this proposed data standard resides. The odds of the item changing form over time is increased, therefore, the risk of using this entity or attribute is HIGH, but lower than defining another data standard with the same characteristics.

1.1 Presentation Format and Conventions

Six columns of information are displayed in the table.

NO. COLUMN COMMENT

1. COUNTER NUMBER

The DDDS Counter-Id for the data standard.

2. VERSION NUMBER

The DDDS version of the data element.

3. STATUS

The DDDS Status of the data element as of the cutoff for the current Quarterly DDM Report cutoff date.

4. ENTITY / ATTRIBUTE NAME

The name of the DDDS Prime Word or Data Element.

PROPOSAL PACKAGE TITLE

The Data Standardization Proposal Package Name with which the latest change in status is associated.

6. TYPE OF CHANGE

A text description of the type of change in DDDS status from the previous version of the Quaterly DDM baseline to the new baseline Report.

Section 9

Functional Area Using Model Report

SECTION 9 Functional Area Using Model Report

1.0 INTRODUCTION

This section contains the list of Functional area-defined using models assign to Candidate and Approved status as of the DDM version 1-98 cutoff date. A "using model" is a name associated with mulitple prime words in the DDDS to specify a logical data model of interest. All DoD data standards, by definition, belong to the DoD Data Model Using Model.

Six columns of information are displayed in the table.

NO. COLUMN COMMENT

1. DATA USING MODEL NAME

The Using Model Name associated with the DDD DATA STANDARD NAME.

2. DATA STEWARD

The functional community for which the using model is defined.

3. DDDS COUNTER ID

The DDDS Counter-Id for the data standard.

4. DDDS VERSION

The DDDS version of the data element.

5. DDDS STATUS

The DDDS Status of the data element as of the cutoff for the current Quarterly DDM Report cutoff date.

6. DDDS DATA STANDARD NAME

The name of the DDDS Prime Word.

IDEF1-x Modeling Conventions

1.0 IDEF1X DATA MODELING CONVENTIONS

Whenever data structures and business rules required to support a functional area need to be specified, it is convenient to build a data model in order to capture that information. A data model is a graphical and textual representation of analysis that identifies the data needed by an organization to achieve its mission, functions, goals, objectives, and strategies to manage and rate the organization (FIPS 184, 1993) It encompasses the entity definitions, relationships, and the integrity constraints through which the information created and used by the functional activity is managed, and from which standard data are created. (DoD 8020.1, 1992)

Having identified what a data model is, one still needs a structured syntax to begin expressing information requirements. IDEF1X, a semantic data modeling technique created to help design data, provides such a structured environment.

The following sections provide a brief description of the IDEF1X syntax as discussed in the Federal Information Processing Standard Publication 184, "Specification for Integration Definition for Information Modeling (IDEF1X)", January 1993.

1.0.1 ENTITIES AND ATTRIBUTES

An entity is a physical or conceptual object that is of interest to an enterprise. In information system design and development, an entity represents the information about an object that is created, managed, used, or stored in a data base. In a conceptual schema language, an entity is the collection of information about a person, place, thing, event, or concept which is important to an enterprise. (DoD 8320.1-M-X).

IDEF1X distinguishes between independent and dependent entities. An entity is independent if each instance of the entity can be uniquely identified without determining its relationship to another entity. An entity is dependent if the unique identification of an instance of the entity depends upon its relationship to another entity. Figure A-1 shows the symbols associated with independent and dependent entities.

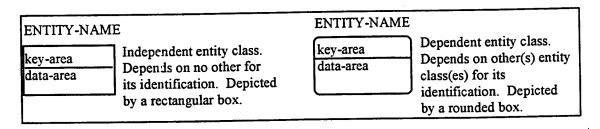

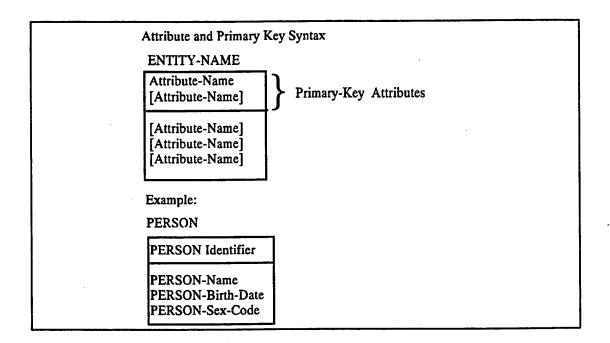

Figure A-1: IDEF1X Symbols for Independent and Dependent Entities

An attribute represents a characteristic or property associated with a set of real or abstract things (people, objects, places, events, ideas, etc.). An entity must have an attribute or

combination of attributes whose values uniquely identify every instance of the entity. This attribute (or these attributes) form the **primary key** of the entity. Those attributes which describe the entity and do not uniquely identify it are called non-key attributes. For example, the attribute PERSON Identifier might serve as the primary key of the entity PERSON while the attribute PERSON Birth Date would be a non-key attribute. All primary keys are depicted above the line in an entity box while the non-key attributes fall below the line. (See Figure A-2)

Figure A-2: Attribute and Primary Key Syntax

.

The IDEF1X syntax further categorizes attributes according to their diverse uses in either the key-area or the data area of the entity. Table A-1 summarizes these different usages.

attribute (FK)	Foreign Key Primary key of another entity contributed by a relationship.
role name.attribute (FK)	Role Name New name for a foreign key connoting its use.
attribute (AKn)	Alternate Key Alternate unique identifier of the entity.

Table A-1: IDEF1X Attribute Notation

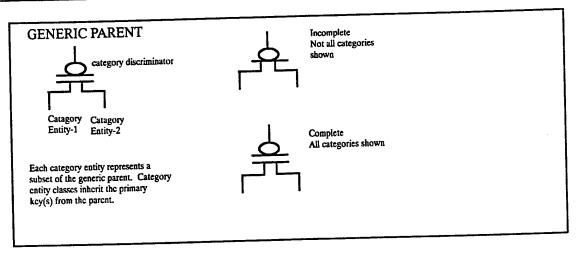

1.0.2 CATEGORY NOTATION

A data model may contain a series of entity classes which share one or more attributes. IDEF1X provides a method for aggregating these common attributes into a base entity, while retaining the subtypes with their unique properties. This convention eliminates unnecessary duplication of attributes and helps to describe the business rules that control the creation, management, and use of data. In other cases, a category entity may be needed to express a relationship which is valid for only a specific category, or to document the relationship differences among the various categories of the entity.

Figure A-3 shows the two types of category supported by IDEF1X. If the listing of the subtypes is comprehensive, the category is complete and the double line is used to indicate this fact. If the subtypes depicted are only a fraction of the complete set, then the category is incomplete and only one line is used in the symbol. The subtypes of the generic parent inherit all the attributes of that parent, and may spawn their own unique relationships and subtypes if necessary.

Figure A-3: IDEF1X Syntax for Entity Categories

1.0.3 RELATIONSHIP NOTATION

A relationship is an association between two entities. IDEF1X allows two main types of relationship, namely, specific relationships and non-specific relationships. Specific relationships can be either identifying or non-identifying and each of these can be mandatory or optional.

1.0.3.1 Specific Relationship

A specific relationship is an association or connection between entities in which each instance of one entity (referred to as the parent entity) is associated with zero, one, or many instances

of a second entity (referred to as the child entity), and each instance of the child entity is associated with zero or one instance of the parent entity. The cardinality of the association depicts how many instances of the child entity may exist for each parent instance and how many instances of the parent entity may exist for each child. A specific relationship is depicted as a line drawn between the parent entity and the child entity with a dot at the child end of the line. The default child cardinality is zero, one or, many. A "P" (for positive) is placed beside the dot to indicate a cardinality of one or more. A "Z" is placed beside the dot to indicate a cardinality of zero or one. If the cardinality is an exact number, a positive integer is placed beside the dot. If the cardinality is a range, the range is placed beside the dot. Other cardinalities (for example, more than 3, exactly 7 or 9), are recorded as notes placed beside the dot. See Figure A-4.

Figure A-4: Relationship-Cardinality Syntax

1.0.3.1.1 Identifying Relationship

If an instance of the child entity is identified by its association with the parent entity, then the relationship is referred to as an identifying relationship, and each instance of the child entity must be associated with exactly one instance of the parent entity. A solid line depicts an identifying relationship between the parent and child entities. See Figure A-5. If an identifying relationship exists, the child entity is always a dependent entity, represented by a rounded corner box, and the primary key attributes of the parent entity are also migrated primary key attributes of the child entity. If the parent entity is a child entity in any identifying relationship, it is always shown as a dependent entity with rounded corners, regardless of its role in the other relationships.

Figure A-5: Identifying Relationship

1.0.3.1.2 Non-Identifying Relationship

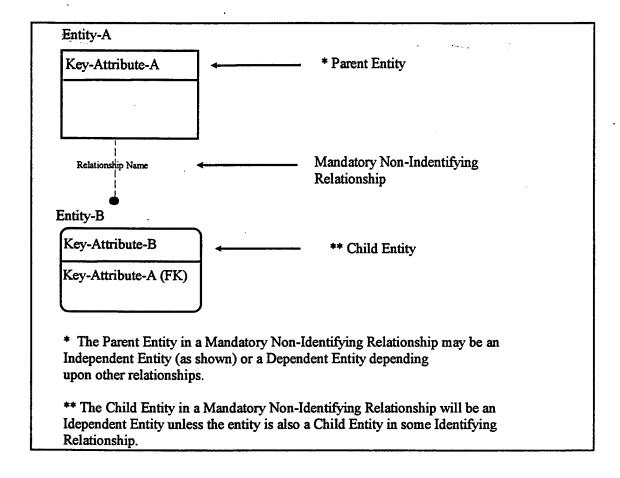

If every instance of the child entity can be uniquely identified without knowing the associated instance of the parent entity, then the relationship is referred to as a **non-identifying relationship**. A dashed line depicts a non-identifying relationship between the parent and child entities. Both parent and child entities will be independent entities in a non-identifying relationship unless either or both are child entities in some other relationship which is an identifying relationship.

1.0.3.1.2.1 Mandatory Non-Identifying Relationship

In a mandatory non-identifying relationship, each instance of the child entity is related to exactly one instance of the parent entity. See Figure A-6.

Figure A-6: Mandatory Non-Identifying Relationship

1.0.3.1.2.2 Optional Non-Identifying Relationship

In an **optional** non-identifying relationship, each instance of the child entity is related to zero or one instances of the parent entity. A dashed line with a small diamond at the parent end depicts an optional non-identifying relationship between the parent and child entities. See Figure A-7.

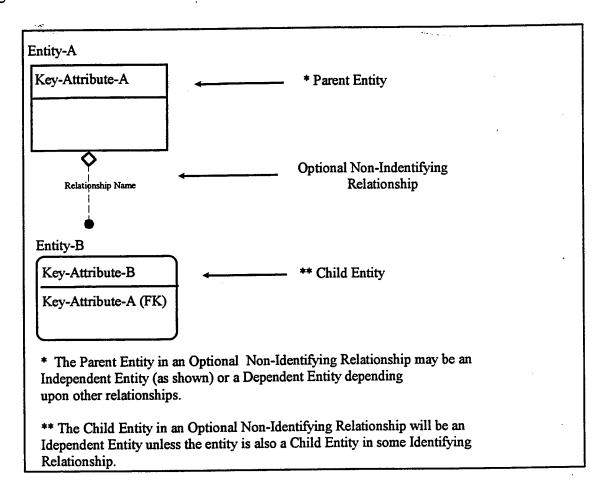

Figure A-7: Optional Non-Identifying Relationship

An optional non-identifying relationship represents a conditional dependency. An instance of the child in which each foreign key attribute for the relationship has a value must have an associated parent instance in which the primary key attributes of the parent are equal in value to the foreign key attributes of the child.

1.0.3.2 Non-Specific Relationship

Non-specific relationships are used in high-level Entity-Relationship views to represent many-to-many associations between entities. Specific relationships define precisely how instances of one entity relate to instances of another entity while non-specific relationships, also referred to as "many-to-many relationships", represent an association between two entities in which each instance of the first entity is associated with zero, one, or many instances of the second entity and each instance of the second entity is associated with zero, one, or many instances of the first. Although the most general case occurs when both entities are independent, a many-to-many relationship can also exist between an independent entity and a dependent entity (parent-child pair). When such a relationship is used in an IDEF1X model, no keys are migrated and many instances of the first entity are related to many instances of the second entity. A non-specific relationship can be further defined by specifying the cardinality from both directions of the relationship.

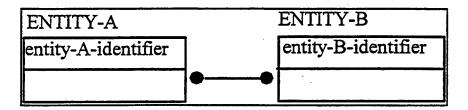

Figure A-8: Many-to Many Relationship

In a key-based or fully-attributed view, all associations between entities must be expressed as specific relationships. IDEF1X provides for the resolution of a many-to-many relationship by means of an associative relationship. Figure A-9 schematically shows the result of this operation. Notice that as part of the resolution of the many-to-many relationship, the ASSOCIATIVE ENTITY inherits as foreign keys (FK) the keys from the two entities originally involved in the many-to-many relationship.

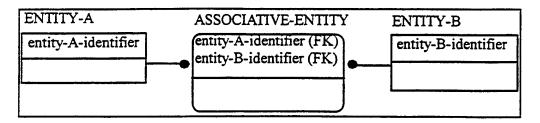

Figure A-9: Resolution of a Many-to-Many Relationship

1.0.4 ROLE NAMES

When an attribute migrates into an entity through one or more than one relationship, a "role name" may need to be assigned to each occurrence to distinguish among them. If an instance of an entity can have one value for one occurrence, and another value for another, then each occurrence must be given a different role name. On the other hand, if each instance of the entity must have the same value for two or more occurrences, they must each have the same name.

The Federal Information Processing Standards Publication 184 states that, although a role name is not required when a single occurrence of an attribute migrates, a role name may be used to more precisely convey its meaning within the context of the child entity. For the purposes of Data Element Standardization within the Department of Defense, however, the recommendation is to avoid the use of IDEF1X role names, except where it is absolutely necessary to portray the business rules that must be maintained to assure data integrity or the semantic meaning of the data requirement. Role names will not be standardized within the Department of Defense.

1.0.4.1 Role Name Attribute Naming Conventions

The name of a role name attribute should contain the IDEF1X role name (role designator) and the name of the original attribute (base name), as shown in Figure A-10.

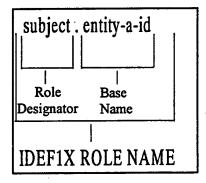

Figure A-10:
Recommended Attribute Naming Conventions for Restricted Circumstances Where
Role Names Must Be Applied

1.0.4.2 Circumstances Where IDEF1X Role Names May Be Assigned

There are only three situations where the attribute naming convention shown in Figure A-10 should always be applied. The first situation is where an associative entity is used to relate an entity to itself. The second situation is to avoid the unintentional unification of the keys

in dependent entities where the base name for the attribute occurs more than once. The third situation is to describe the intentional unification of two attributes that have been assigned IDEF1X role names. These three situations are illustrated below.

1.0.4.2.1 Associative Entity

Figure A-11 shows an associative entity which is used to record the relationship between the occurrence of ENTITY-A and another occurrence of ENTITY-A. This construct is useful in showing business rules suggested by a hierarchical relationship between two occurrences of an entity. For example:

A PERSON manages zero, one, or many PERSONs:

A PERSON is managed by zero, one, or many PERSONs.

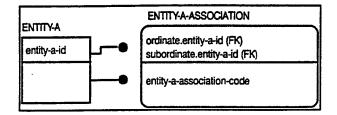

Figure A-11: ASSOCIATIVE-ENTITY and Attribute Naming Convention

As illustrated in Figure A-11, the associative entity contains three attributes. The first two are the ENTITY-A identifier. The third is a non-key attribute. Following the recommended attribute naming conventions, since the ENTITY-A identifier migrates twice, a role name is required to distinguish between each occurrence. The attribute names should be recorded as follows:

ordinate.entity-a-id subordinate.entity-a-id

The non-key attribute should be recorded as: entity-a-association-code. This attribute has no IDEF1X role name.

1.0.4.2.2 Avoiding Unintentional Unification of Keys

The second circumstance that requires the use of the role name is illustrated in Figure A-12. It is similar in some ways to the associative entity example shown above.

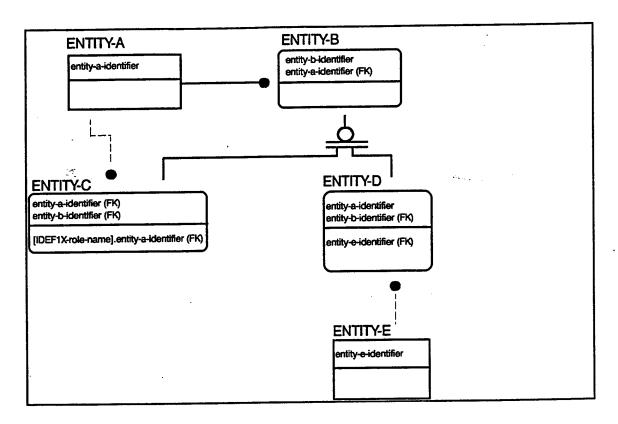

Figure A-12: Avoiding Unintentional Unification of Keys

In this case, the ENTITY-A identifier migrates to ENTITY-C through the non-identifying relationship <u>and</u> through the identifying relationship from ENTITY-B. To distinguish between the two occurrences of the ENTITY-A identifier in ENTITY-C, a role name is attached to the migration through the non-identifying relationship. This convention is consistent with IDEF1X principles on the use of role names to distinguish between two different occurrences of the same entity. Note that the primary key of ENTITY-E was not assigned a role name when it migrated to ENTITY-D. A role name in this situation is not warranted.

1.0.4.2.3 Describing the Intentional Unification of Keys

Under certain circumstances, an IDEF1X role name is required to intentionally unify the keys that are posted to an entity. There are rare occasions where this may occur. Figure A-13 suggests a situation where: (1) role names have been applied to avoid the unintentional unification of keys and (2) role naming is applied again to support the unification of the keys under the entity UNIFICATION.

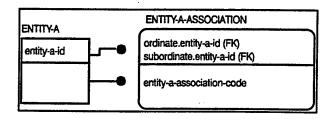

Figure A-13: Describing the Intentional Unification of Keys

Migrating the Compound Key of ENTITY-A-ASSOCIATION to Another Entity Named (UNIFICATION) May Describe a Case Where the Use of One Role Name Would Represent More than One Migrating Attribute

1.0.5 SUMMARY

In using data models in support of data element standardization, several features are worth noting in connection with attribute naming conventions. First, DoD 8320.1-M-1 requires the use of entity names as prime words in data element names. For example, in Figure A-12, the attribute owned by ENTITY-A has the entity name as part of the attribute name: entity-a-identifier. This convention allows for determining the ownership of an attribute through both the data model representation and the name of the attribute. Nevertheless, care should be taken in developing role names for attributes as described under IDEF1X. Recent experience in model integration suggests that role names should be used sparingly and only in situations as outlined above.

Second, modelers are warned against adopting attribute naming conventions that make use of entity names as prime word modifiers in attribute names. This convention leads to long and unwieldy names for attributes. As an alternative to embedding context information in the attribute name, the recommendation is to treat the entity context information as another piece of metadata. This rule applies to foreign keys and requires the explicit identification of: (1) entities that use the primary key(s) of another entity as a foreign key and (2) the IDEF1X role name that is assigned to the foreign key(s).

Finally, in terms of attribute naming rules, attribute unification is the accepted norm. What this translates to is illustrated in Figure A-14. As shown, no IDEF1X role name is assigned to the attribute: action-id. Its use in the ACTION-RESOURCE, ACTION-OBJECTIVE, and ACTION-RESOURCE-EMPLOYMENT entities reflects the naming conventions that are being advocated. As shown, there is an intentional unification of the action-id under ACTION-RESOURCE-EMPLOYMENT.

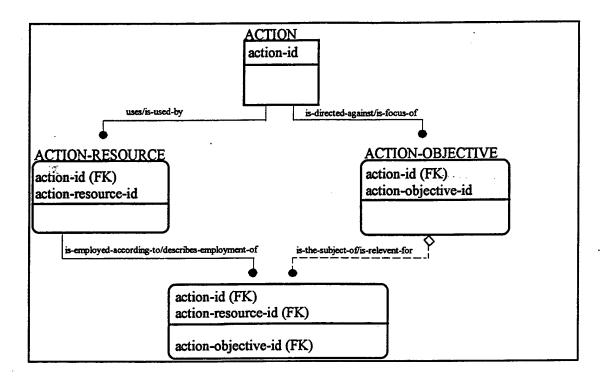

Figure A-14: Intentional Unification of Attribute Keys

The naming convention outlined above simplifies the naming of attributes and makes the data model much more usable. At the same time, the conventions combine both DoD 8320.1-M-1 data element naming rules and IDEF1X principles on role names.

Appendix B

Acronyms

APPENDIX B: ACRONYMS

<u>Acronym</u>	<u>Meaning</u>
C2	Command and Control
CASE	Computer Aided Software Engineering
COE	Common Operating Environment
CUDA 👩	Common Utilities for Data Administration
DoD	Department of Defense
DDDS	Defense Data Dictionary System
DDM	DoD Data Model
DII	Defense Information Infrastructure
FDAd	Functional Data Administrator
FIPS	Federal Information Processing Standard
GCCS	Global Command and Control System
IDEF-1x	Integration Definition For Information Modeling
IEV .	Independent Entity View
JOPES LDM	Joint Operations Planning Execution System Logical Data Model
MAISRC	Major Automated Information System Review Council
SHADE	Shared Data Environment
Web	Internet and World Wide Web

Obtaining a Softcopy or Hardcopy of the DoD Data Model

APPENDIX D: Obtaining Softcopy or Hardcopy of the DoD Data Model

1.0 INTRODUCTION

The DoD Data Model (DDM) is available in softcopy. Currently, the DDM View (View) data map files reside on the Burns server, and in the near future will be placed on the DISA World Wide Web homepage, http://www-datadmn.itsi.disa.mil. The Burns server has an Internet Protocol (IP) address of 134.205.118.48. Navigation to the server is accomplished by using the stated IP address through the File Transfer Protocol (FTP). FTP software allows files to be copied from the designated directory on this server to your working environment. A basic set of instructions will be presented later in this document.

The current baseline of the DDM, created 31 May 98, and the latest updates (working version) for each subject area between baseline creations will be available to the community. View data files will be updated periodically to reflect changes to their data requirements based on updates to the candidate and approved data in the DDDS. The filename.er1 files are based on the ERwin version 2.6 application. This application is needed to bring up the data maps in softcopy directly. To determine the files of interest to retrieve, review the ReadMe.doc file.

NOTE: Always review the ReadMe.doc file for the latest information regarding the data maps.

Below are simple directions for downloading the DoD Data Maps. The user will need a Burns logon and password. Detailed instructions for FTP access will vary from site to site. Please check with your local network administrator for instructions that are conducive to your particular environment. In softcopy, the view data maps contain all entities, attributes, and relationships which supply the required foreign keys. The additional entities, which supply foreign keys to the display entities, are in main subject area view within the IDEF-1x diagram.

1.1 Access to Softcopy of DDM

Since FTP application software methods differ, check with your local network administrator or help desk for the proper access method for your installation. You will need a Burns logon and password to access the files via FTP.

Once in your site FTP application software, perform the following:

- 1. Connect to FTP by using the IP address 134.205.118.48.
- 2. UNIX users enter the same IP address for the Host line (134.205.118.48).
- 3. UNIX users enter "UNIX" for the Host Type.
- 4. Enter user identification (logon id)" for the entry User Name.
- 5. Enter user's password for the Password.
- 6. Select "enter."

You are now logged into the server where the DDM data files reside.

- 7. Once connected to FTP, select the File pull down menu and choose "Change Directory." Type "lencyclddm-198." (the 1-98 DDM directory). While in this directory, the user can:
 - select files by Views, Entities, or Subject Area;
 - copy the interested files from FTP to a working directory by using the drag and drop method.

This directory houses the ERwin data maps for the 1-98 release. For a cross reference list of which ERwin data map files correspond to which Views, the user should reference the **ReadMe.doc** file. (Refer to the *Data Representation* section for an example of the naming convention used.)

For questions regarding access to FTP files, contact your local network administrator or local help desk.. For questions concerning the DDM, call Ali Nikolai at (703) 790-7446 or Jim Holt at (703) 556-7025. You may also call Ken Fagan at (703) 735-3091 or DSN 653-3091. Questions regarding specific file transfer modes should be referred to your local help desk.

1.2 Access to Softcopy of DDM on the World Wide Web (WWW)

1. Users may obtain Burns logon by accessing the DoD DISA Internet Home Page: http://www.disa.mil.

The DISA Home Page contains an electronic version of the access registration form. DDM files may be obtained with query-level access.

- 2. Access to a File Transfer Protocol (FTP) software package is accessible from your computer. Check with your LAN administrator for FTP access.
- 3. Views and associated DDDS metadata will be accessible on the World Wide Web (WWW) at the DISA DoD Data Administration home page

(http://www-datadmn.itsi disa.mil)

A notice of the release date will be placed in the DDDS Bulletin Board.

NOTE:

- Ensure that the file format specified is BINARY in your FTP software.
- When opening the interested data map in ERwin 2.6 or higher version, always operate from the named View and <u>NOT</u> the main subject area view. The named view can be accessed through the "Window" menu item on the menu line at the top of the screen.
- The Print Scaling must be set to 70% for proper viewing of the data models. Scaling allows for easy viewing of the diagrams on both the computer screen and in printed format. Select the "File" menu item and then choose the "Print Setup" option. Within the Print Setup dialog box, first click on Landscape and then choose the Properties button. A scaleable printing option is displayed. The correct scale for viewing and printing the data map is 70%.

For questions regarding access to FTP files, contact your local network administrator or help desk.

Transmission errors may affect the successful transfer of files from UNIX to your working directory. If a file is corrupted during transmission, re-transmit the file again. The easiest way to detect transmission errors, is to compare the file sizes between the file residing on the Burns server and the size of the file copied to your working environment.

For questions concerning the DDM, call Ali Nikolai at (703) 790-7446 or Jim Holt at (703) 556-7025. You may also call Ken Fagan at (703) 735-3091 or DSN 653-3091.

1.3 Access to Hardcopy of DoD DDM

Printed copies of the DDM are available through the Defense Technical Information Center (DTIC) (800) 225-3842.
